BSN MARKET

Corrective Prompt for Google AI Studio

Use this prompt in the existing BSN Market project to improve the interface so it looks and behaves like a polished, mobile-first shopping app—without rebuilding or breaking working systems.

COPY AND PASTE THE PROMPT BELOW

ROLE AND OBJECTIVE

Act as a senior product designer and frontend engineer. Improve the existing BSN Market application so it looks and feels like a professional, modern, mobile-first multi-vendor shopping app comparable in usability to leading e-commerce apps. The current app has been generated, but its interface does not look or feel like a real shopping app. Focus on correcting the UI, layout, navigation, visual hierarchy, responsiveness, and interactions.

FIRST: INSPECT BEFORE EDITING

Inspect the existing codebase, routes, components, styles, database integration, and current functionality before making changes. Identify what already works and build on it. Do not blindly replace the application or start a new project.

NON-NEGOTIABLE PRESERVATION RULES

• Preserve the existing architecture, project structure, filenames, routes, and working components wherever possible.
• Do not remove or break Supabase authentication, database queries, storage, row-level security (RLS), customer accounts, retailer onboarding, retailer dashboards, admin tools, cart, checkout, payment processing, orders, notifications, or any other working feature.
• Do not replace real backend data with mock products, hardcoded users, fake orders, or demo-only functionality.
• Do not expose secret keys or move privileged operations into client-side code.
• Make targeted, incremental changes. If a feature is already working, preserve it and improve only what is necessary.

DESIGN DIRECTION

Create a clean, credible, modern shopping experience. Use a restrained colour palette, consistent spacing, readable typography, clear product photography, subtle borders and shadows, and strong visual hierarchy. Avoid excessive colours, cluttered layouts, oversized empty spaces, and generic dashboard styling on the customer storefront. The result should look like a real retail app, not a basic generated website.

CUSTOMER HOME / STOREFRONT

Build or refine the home screen with:
• A compact top bar with the BSN Market brand and a location/delivery area where supported.
• A prominent, functional product search field.
• Horizontally scrollable product categories that work well on mobile.
• A visually strong promotional banner or campaign area, using existing real content when available.
• Clearly labelled sections such as Featured Products, Popular Products, New Arrivals, or relevant existing categories—only when backed by available data.
• A responsive product grid with consistent product cards, image proportions, product names, prices, and clear actions.
• Loading, empty, and error states that are designed intentionally and explain what the customer can do next.

MOBILE NAVIGATION AND RESPONSIVENESS

Prioritise mobile usability. Add or refine a fixed bottom navigation bar for the main customer destinations, such as Home, Categories, Cart, Orders, and Account, mapping each item to the application's existing routes and functionality. Do not create duplicate routes if equivalents already exist. Ensure navigation is thumb-friendly, active states are clear, and content is not hidden behind the bottom bar. Test at approximately 360 px, 390 px, 768 px, 1024 px, and desktop widths up to 1440 px. Prevent horizontal overflow and make forms and buttons comfortable to use on touchscreens.

PRODUCT DISCOVERY AND DETAILS

Make product cards and search results visually consistent and usable. Ensure a product can be opened to a product detail screen showing the real product image, name, price, description, availability, retailer information where supported, quantity controls where appropriate, and a clear Add to Cart action. Keep category filters, search, sorting, and product links connected to real data and existing backend logic. Do not invent product attributes that the database does not provide.

CART. CHECKOUT. AND ORDERS

Improve the presentation and usability of the existing cart, checkout, payment, and order-history screens. Make totals, quantities, delivery details, and next steps easy to understand. Preserve the current payment provider and backend verification flow. Do not simulate successful payments or mark an order as paid based only on a client-side action. Keep payment verification server-side and retain existing webhook behaviour.

RETAILER AND ADMIN EXPERIENCES

Keep retailer and admin areas distinct from the customer shopping storefront. Improve their layout and readability without removing current features or permissions. Retailers should retain access only to their permitted products, inventory, orders, and relevant dashboard features. Admin-only actions must remain protected by existing role checks and server/database permissions. Do not weaken authentication or RLS policies to make the interface work.

INTERACTIONS AND ACCESSIBILITY

Every visible button, tab, search field, filter, product card, navigation item, and form must do what its label promises. Remove dead buttons and placeholder interactions. Provide visible focus states, accessible labels, sensible contrast, clear validation messages, and confirmation/error feedback. Keep transitions subtle and performance-friendly.

IMPLEMENTATION AND VALIDATION

Before changing code, summarise the key UI issues you found and the files you intend to edit. Then implement the smallest set of changes needed. Reuse existing components and design conventions where sensible. Do not rename files or make unrelated backend changes. After implementation, run the available build, lint, and tests; fix errors caused by your changes. Check customer, retailer, and admin flows, including authentication, product browsing, cart, checkout, and order access, to the extent supported by the existing test setup. Report which files changed, what was improved, what was tested, and any remaining issues. Do not claim a test passed unless you actually ran it.

FINAL PRIORITY

The priority is to make BSN Market feel like a polished, trustworthy shopping app on mobile and desktop while preserving all existing working functionality and real backend integrations. Improve the interface in place; do not rebuild the application from scratch.
